

Accessible design starts before students ever click.

Plan for readability, captions, structure, and flexibility from the start so more learners can access the lesson.

Accessible lesson

Readable

Flexible

Inclusive

Design choices that support access

- Use true text instead of text baked into images.
- Keep hierarchy clear with strong headings and spacing.
- Use orange as an accent, not as the main text color.

Build accessibility into every phase.

This keeps access from becoming an afterthought and makes revisions easier later.

Analyze

1

Identify learner variability, language supports, device access, and barriers before you plan.

Design

2

Choose clear structure, readable layouts, multiple formats, and purposeful interaction.

Develop

3

Use true text, alt text, captions, headings, and accessible file formats.

Implement

4

Model the tools, explain directions clearly, and give more than one way to participate.

Evaluate

5

Test on phone, keyboard, and screen reader; then revise from real learner feedback.

Ask this before you publish:

Can students read it, hear it, navigate it, and use it on a phone without extra help?

5 quick checks

Check access before you publish.

A strong story graphic should model the same accessible choices it recommends.

1

Use true text + headings

Make titles, labels, and lists selectable, structured, and easy to scan.

2

Keep contrast readable

Use high contrast and large, clean fonts for fast mobile reading.

3

Add alt text + captions

Support images, audio, and video with equivalent text access.

4

Offer multiple ways in

Let students read, listen, watch, respond, and revisit content.

5

Test the real experience

Preview on a phone and try keyboard-only navigation before posting.

Accessible by design = more inclusive by default.

When educators design for clarity, flexibility, and multiple access points, more students can participate without needing special workarounds.
